

How to Make a QR Code for Your Facebook Page

1

Open your Facebook page in a browser

Be sure you're looking at the public page people actually see, not the admin view. The address should read something like `facebook.com/YourPageName` or `facebook.com/profile.php?id=...`

2

Copy the address from the bar at the top

Go with the tidy version — `facebook.com/YourPageName` — whenever you can. A shorter link makes a cleaner, easier-to-scan QR code.

3

Paste it into Easy QR

Your QR code shows up right away. Download it as a PNG, JPG, or SVG and you're good to print.

4

Try it with your own phone

Point your camera at the code and check that it opens your Facebook page — in the Facebook app if you have it, otherwise in the phone browser.
